Define the Problem Statements

Date	October 3, 2026
Team ID	SWTID-2026-6228
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Customer Problem Statement:

Employee information is often maintained in spreadsheets, but it has to reach ServiceNow as accurate, consistent records. This project, **Import Data using Transform Maps (Spreadsheet)**, addresses the problems faced when that data is moved into the **Employee Test** table.

Defining these problems from the user's point of view clarifies what must be solved: a structured import path from the spreadsheet to the target table, with field mapping, a unique identifier and verification of the result.

I am	- A ServiceNow administrator or HR data coordinator - Keep employee details (Employee ID, Name, Email, Department, Location) in an Excel spreadsheet - Responsible for accurate employee records in the Employee Test table
I'm trying to	- Import the spreadsheet data into ServiceNow in one structured step - Update existing employees without creating duplicate records
but	- Manual entry is time-consuming and error-prone - It leads to duplicate or inconsistent employee records - Spreadsheet columns do not automatically match the target table fields - Importing the same data again can insert the same employee twice
because	- There is no staging Import Set Table or Transform Map to define the field mapping - No unique field such as Employee ID is used to match existing records - Imported data is not verified after the transform
which makes me feel	- Frustrated and overloaded by repetitive work - Uncertain whether the employee data can be trusted

Example:

I am	I'm trying to	But	Because	Which makes me feel
an HR data coordinator	import employee data from a spreadsheet	it takes a long time and creates duplicates	records are entered manually with no field mapping or Employee ID check	Frustrated

Problem Statement: Employee data kept in a spreadsheet cannot be entered into ServiceNow quickly and reliably by hand. Manual entry is slow and produces duplicate or inconsistent records, spreadsheet columns have no defined mapping to the Employee Test table, repeated imports can create duplicates without a unique field such as Employee ID, and the imported data is not verified after transformation.

Data Flow Addressed by the Project:

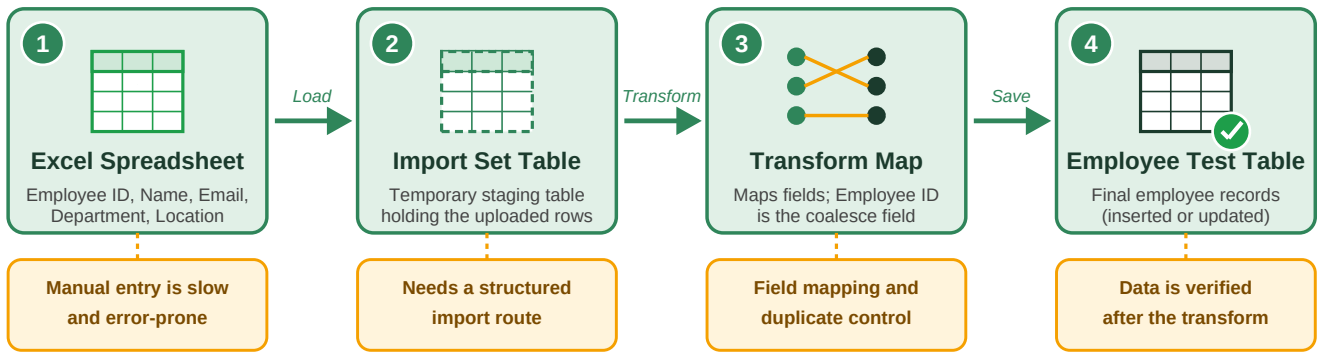

Figure: Spreadsheet data flows through a staging table and a Transform Map into the Employee Test table. Orange boxes show the problem each stage addresses.

Supporting Points:

- **Time-consuming manual entry:** typing each employee's details one record at a time takes long and does not scale as the spreadsheet grows.
- **Duplicate or inconsistent records:** manual typing introduces errors, such as the same employee entered twice or with different spellings.
- **Need for a structured import:** spreadsheet data needs a defined route into ServiceNow, which is an Import Set Table followed by a Transform Map.
- **Field mapping:** columns such as Employee ID, Name, Email, Department and Location must be mapped to the matching fields of the Employee Test table.
- **Repeated imports:** without a unique field, importing the same file again, for example employee EMP001 appearing in two uploads, creates a second record. Using Employee ID as the coalesce field updates the existing record instead.
- **Validation and verification:** after the transform, the import set rows (inserted, updated or error) and the Employee Test records must be checked to confirm the data is correct.

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	an administrator maintaining employee records	add employee details from a spreadsheet to ServiceNow	manual entry is slow and repetitive	each record has to be typed individually	frustrated and overloaded
PS-2	an HR data coordinator	keep employee records accurate and consistent	manual entry creates duplicate or inconsistent records	typing errors and no unique-field check	worried about data accuracy
PS-3	a ServiceNow administrator	load spreadsheet data into the Employee Test table	spreadsheet columns do not match the target fields	no Import Set Table and Transform Map define the field mapping	uncertain about the import
PS-4	an administrator importing the same data repeatedly	update existing employees without adding duplicates	the same employee is inserted again on each import	Employee ID is not set as the unique (coalesce) field	concerned about data quality
PS-5	an administrator checking the import	confirm the imported data is correct	blank fields or errors go unnoticed	results are not verified after the transform	unsure the records can be trusted
