Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-9928
Project Name	Import Data Using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Proposed Solution

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Organizations often receive large employee datasets in Excel or CSV files. Manually entering or copying these records into ServiceNow is time-consuming and can cause field-mapping errors, inconsistent data, duplicate records, and poor data integrity. Repeated imports also require a reliable way to distinguish new employees from existing employees.
2	Idea / Solution description	The proposed solution uses ServiceNow Import Sets and Transform Maps to automate spreadsheet-based employee data ingestion. Source Excel/CSV data is first loaded into an Import Set staging table. A Transform Map then maps source fields such as Employee ID, Employee Name, Email, Department, and Location to the Employee Test target table. Coalesce is enabled on a unique field such as Employee ID so existing records are updated while new records are inserted. Reports and an Employee Analytics Dashboard provide visibility into the resulting employee data.
3	Novelty / Uniqueness	The solution combines controlled staging, configurable field mapping, transformation, duplicate prevention, execution history, and visual reporting in one ServiceNow workflow. Auto Map Matching Fields and Mapping Assist reduce mapping effort, while Coalesce makes repeated spreadsheet imports safe by distinguishing updates from new records. The workflow also provides traceability through transform history and reports.
4	Social Impact / Customer Satisfaction	The solution reduces repetitive administrative work and improves the reliability of employee information used by administrators and HR teams. Faster and more accurate imports reduce delays caused by manual data entry. Reports and dashboards give users a centralized view of employee records, supporting easier monitoring and reducing the effort required for manual analysis.
5	Business Model (Revenue Model)	The solution can be offered as an enterprise ServiceNow implementation or automation service. Potential revenue can come from implementation and configuration projects, customization of Transform Maps and business rules, integration support, maintenance, training, and recurring enterprise support services. The model is therefore primarily B2B and service-based.
6	Scalability of the Solution	The approach can be extended beyond employee records to assets, customers, vendors, incidents, and other structured datasets. Additional Import Set tables, Transform Maps, validation rules, Coalesce fields, and reports can be configured for different data sources. The same staged ingestion pattern can support recurring bulk imports and larger enterprise data-management workflows while retaining centralized monitoring through dashboards.
